

Synel for Hospitals & Healthcare Services

Efficient online management of medical staff

Hospitals and healthcare services are large organizations characterized by the need to know, during an **emergency event**, the presence and position of each staff member within each department.

Hospital manager and department managers must be able to receive and view this information online, to be able to make quick and correct decisions according to medical and Para medical staff availability - transfer of staff members from one department to another, call up of additional personnel, allocation of standby staff, and more. Healthcare facilities are also characterized by the large number of laboratories, drug rooms, cabinets and sensitive zones, for which entrance is strictly forbidden for unauthorized people.

In addition, since work hours in such organizations are largely based on shifts, shift scheduling is a vital feature in the management of attendance and payroll preparation.

Synel's solution does all that, as well as efficient parking zone management and meals management for all staff members, outsourcers and visitors - all in ONE system!

Benefits

- **Efficient HR management per department, position**
- **During emergency situation - online data availability for department managers on employees presence, availability and position**
- **Large savings due to effective control over perishable and non-perishable equipment - drugs and medications**
- **Effective handling of parking facilities, space allocation per department, position etc.**
